

Market Research: Collaboration & Analytics SaaS (2026)

Executive Summary

Enterprise buyers increasingly gate purchases on security and identity features. SSO/SAML and SCIM provisioning are now table-stakes for deals above 500 seats. Vendors lacking these lose evaluations late in the cycle, after significant sales investment.

Key Findings

1. Cross-workspace search is a top-3 requested capability among mid-market and enterprise teams; fragmented search is a leading cause of daily friction.
2. Notification overload drives disengagement. Buyers want granular, per-project controls rather than all-or-nothing email.
3. Reliability of integrations (Slack, webhooks) materially affects renewal sentiment; silent webhook failures are a recurring complaint.

Recommendation

Prioritize SSO/SAML, SCIM, and global search to defend enterprise deals against competitors such as Tandem and GridWork, which already ship these out of the box.
